Average Interruptions by Day

Average Energy Level Across Days

KEY FINDINGS

- Burnout is highest during weekdays and decreases towards the weekend
- Work-related activities contribute the most to burnout
- Energy levels show a gradual decline across the week
- Higher interruptions align with higher burnout days

RECOMMENDATIONS

- Balance workload distribution across the week
- Reduce interruptions during focused work sessions
- Schedule rest or lighter tasks on high-burnout days
- Improve planning accuracy to match actual effort

PROJECT SUMMARY

This project analyzes activity data to identify burnout patterns. Using time tracking, energy levels, and interruptions, it highlights key burnout drivers and provides actionable insights to improve productivity and well being.
